

What to Expect during Your Whitening Treatment

Copyright: Linda Greenwall

Your dentist has given you a bleaching kit to take home with you together with your bleaching trays. It is essential that you follow the instructions given by your dentist and the manufacturer's instructions in wearing the trays and applying the bleaching agent. Below are answers to the most frequent questions.

How long should I wear the trays for?

This depends on the amount of lightening that you desire and the original shade of the teeth. If your teeth are quite dark or very yellow/ grey/ tetracycline stained it will take longer to bleach the teeth. If you are not experiencing any sensitivity you may wear the trays for at least 1 – 2 hours and even sleep with the trays in your mouth. It is very important to remove all the excess material around the gums or the palate prior to sleeping with the trays.

The darker your teeth, the longer your teeth will take to get lighter. Tetracycline stained teeth can take 6 months or up to one year to bleach the teeth. Some teeth can whiten after one month.

If you cannot wear the trays for a few days because of your hectic schedule, it does not matter. Bleach your teeth according to your own schedule. Some people put the trays in after dinner and wear them for the first hour while watching TV or doing the dishes. Then if everything is fine they replenish the trays and sleep with them in the mouth.

What do I do if I have any sensitivity?

Sensitivity of teeth is the most common side effect of home bleaching. In fact many patients suffer from sensitive teeth any way. This occurs usually around the necks of the teeth where the gums have receded. If you are experiencing any sensitivity you should stop bleaching your teeth for a few days. You can resume after about 3-4 days. If the teeth become ultra sensitive you can place sensitive toothpaste into the bleaching trays for an hour a day. That will usually stop the sensitivity. Alternatively you can rub the desensitising toothpaste into the gum margins with your finger 5 times per day for a few days.

If you are at all concerned, please call your dentist.

What happens if the teeth do not bleach evenly?

If the teeth have white spots on them before bleaching, these spots will appear whiter during the first few days, however the contrast between the spots and the rest of the tooth will be less and eventually they will not be noticeable. Sometimes the dentist can do a special procedure called Microabrasion for you where the white spots can be more permanently removed. Ask your dentist about the procedure if you are concerned about this.

You may notice new white spots occurring on the teeth while you are undertaking the bleaching treatment. These white spots were already present on the teeth before bleaching. As the teeth become lighter they become more visible. Do not worry. As the whole tooth itself becomes lighter these spots will fade. You may notice these white spots immediately after a bleaching session or in the morning if you have been wearing the trays for the whole night.

Some teeth may appear banded with lighter/ whiter areas. Again these bandings are originally present on the tooth. As the tooth is dark these bandings are not obvious. As the tooth becomes lighter, the lighter parts of the tooth will lighten first followed by the darker banded area. After a week or so these will not be noticeable any more.

How will my teeth feel?

Normally the teeth feel very clean after the bleaching procedure. The bleaching materials also have an indirect effect on the gums in helping them to heal or improving the health of the gums. This is how the technique was invented as it was first used to heal gum irritation during orthodontic treatment.

What about my smile?

Your smile will appear brighter as a bonus. It is very rare, but sometimes the teeth do not lighten at all. If this happens and you are wearing the bleaching trays as recommended, you may need to try a different bleaching product or a slightly higher concentration of the bleaching material. The dentist can do a few "Power bleaching sessions" for you while you relax in the chair. Discuss this with your dentist.

If you have white fillings in the front teeth that match the existing shade of your teeth before you bleach your teeth, they may not match the teeth afterwards. This is because your teeth can lighten, but the fillings do not lighten. When the desired colour has been achieved, the dentist can replace these fillings with a lighter shade of filling material to match the new shade of your teeth. Normally the dentist will wait 2-3 weeks before changing the fillings.

How long does the bleaching last? Will I have to bleach my teeth again?

Normally the new white colour of your teeth keeps quite well. The effect is dependent on what has caused the teeth to discolour in the first place. If you drink lots of coffee, red wine, cola drinks the effect may darken slightly. Some patients do a top up treatment after 3-4 years. Some patients do not need to.

Does Bleaching harm the teeth or gums?

Safety studies have shown that bleaching teeth using the dentist prescribed home bleaching technique is perfectly safe on the teeth, cheeks, gum and tissue of the mouth. Bleaching the teeth with the dentist prescribed kits is equivalent to drinking one soda drink. The bleaching material has a ph, which is neutral.

There are problems with the bleaching kits that are purchased over the counter. Although they are inexpensive, they normally contain an acid rinse, which can damage the teeth or thin down the enamel of the teeth. This acid rinse can be extremely harmful to the teeth. There was a case where a patient purchased the kit over the counter, bleached the teeth. The teeth went darker and the patient continued using the treatment. The darkening of teeth occurred because the acid rinse had worn the enamel away and the darker shade was in fact the dentine that became exposed.

It is not, however, advisable to bleach your teeth if you smoke. It is best to stop smoking for at least 3 weeks before commencing the bleaching procedure. Smoking causes the teeth to become darker anyway and the effects will be diminished.

The technique of Bleaching Teeth is not for everybody. There are some situations where bleaching teeth is contraindicated such as when the front teeth are already crowned or when there are very large fillings on the front teeth or the teeth are already excessively worn and there is evidence of tooth surface loss.
